3. Synopsis

3.1. Component Description

3.2. Test Criteria

Component	Test Criteria
Server1	The total number of sessions opened must reach the specified target within the allotted time.: (maxConcurrentAppFlows>=sessions.target) The total number of failed application transactions must be no more than 5 percent of the attempted application transactions.: ((appUnsuccessful*100)<=(appAttempted*5)) The session rate must reach the specified target within the allotted time.: (maxAppFlowRate>=sessions.targetPerSecond)
Server2	All traffic containing malicious data should be blocked.: (strikesTotal==(strikesBlocked+strikesErrored+strikesSkipped)) No non-data traffic should be blocked by the DUT.: (strikesErrored==0)

3.3. Summary of Results

Component	Test Results	Explanation
Server1	Test passed	
Server2	Test failed	Server2: Malicious traffic was passed through the DUT.
Overall	Test failed

5.5. Test Components

The test utilizes traffic from the set of components described below.

Type	Description
appsim	This component measures the device's ability to handle a variety of application layer traffic flows. It generates realistic application traffic flows, and validates that they are passed correctly by the device.
security_all	This component measures the device's ability to handle security threats by sending live exploits to the device, and verifying that the device blocks the attacks. It realistically simulates the attacker as well as the responses from the host being attacked.

7.25.25. Frame Latency Distribution

This type of data can not be summarized, please view the detailed report sub-sections.

7.25.25.1. Frame Latency Distribution: 1

This chart shows latency ranges on the Y axis. The length of a colored bucket signifies its size relative to the total latency spread. It does not correspond to the number of packets.

The latency buckets are generated each second to an ideal normal curve, real packet latencies should be close but not exactly normal.

Buckets are generated as - bucket1 (dark blue): lowest 2.2%; bucket2 (light blue): low 13.7%; bucket3 (green): middle 68.2%; bucket4 (light blue): high 13.7%; bucket5 (dark blue): highest 2.2%

68.2% of packets sent during the interval (ideally) will be in the middle bucket (green).

Layer 2 and 3 tests on 1Gig blades do not support dynamic latency. These tests will have static 10,100,1000,10000,10000+ ms buckets.

7.25.25.2. Frame Latency Distribution: 2

This chart shows latency ranges on the Y axis. The length of a colored bucket signifies its size relative to the total latency spread. It does not correspond to the number of packets.

The latency buckets are generated each second to an ideal normal curve, real packet latencies should be close but not exactly normal.

Buckets are generated as - bucket1 (dark blue): lowest 2.2%; bucket2 (light blue): low 13.7%; bucket3 (green): middle 68.2%; bucket4 (light blue): high 13.7%; bucket5 (dark blue): highest 2.2%

68.2% of packets sent during the interval (ideally) will be in the middle bucket (green).

Layer 2 and 3 tests on 1Gig blades do not support dynamic latency. These tests will have static 10,100,1000,10000,10000+ ms buckets.

9.7.6.5.2. Ethernet Data Rates: 2

Data Rate shown includes Ethernet overhead.

Rates can fluctuate slightly above the physical maximum due to round-off errors in calculations.

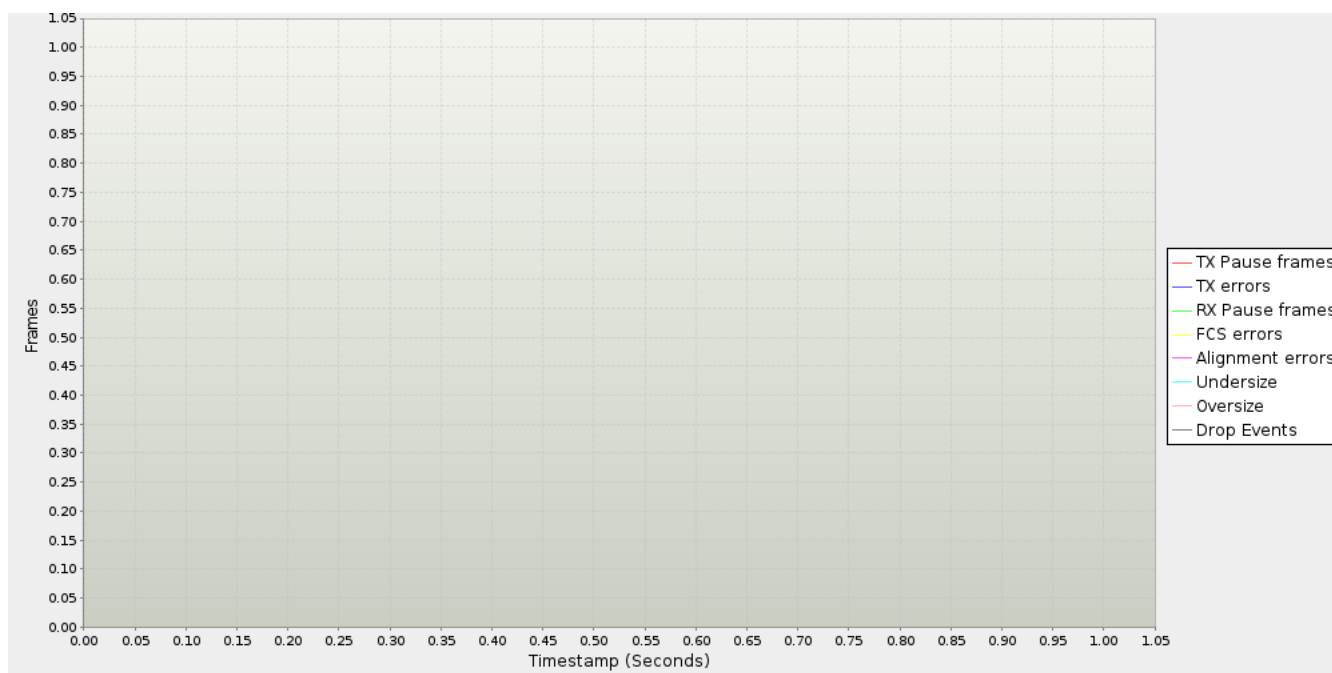

Physical speeds on fiber optic can legitimately exceed 10Gbps.
